

Design System Components

A comprehensive guide to the core building blocks used across our product — from typography and buttons to layouts and cards. Each component is designed to work together seamlessly, creating a consistent and scalable user interface.

All Text Elements

HEADING

BODY TEXT

ABCDEFGHIJKLM

NOPQRSTUVWXYZ

abcdefghijklmn

opqrstuvwxyz

0123456789

Typography covers **all text elements** in the design system, including heading levels h1 through h6, subtitles, and body text. Consistent typographic styles ensure readability and visual hierarchy across every screen and context.

Headings (h1–h6)

Six levels of heading styles for page titles, section headers, and sub-sections

Subtitle

Supporting text that complements headings with secondary context

Body

Primary reading text used throughout content areas and descriptions

BUTTON

User Actions

Buttons are the primary vehicle for **user actions** throughout the interface. Three distinct variants — contained, outlined, and text — provide the right level of visual emphasis for every context, from primary calls-to-action to secondary options.

Contained

Filled background with high emphasis — ideal for primary actions like Submit or Save

Outlined

Bordered style with medium emphasis — suitable for secondary actions like Cancel or Back

Text

Minimal, text-only style with low emphasis — best for tertiary actions like Learn More

BOX

Wrapper for Custom CSS and Layout

What is Box?

The **Box** component is a versatile wrapper that provides a foundation for applying custom CSS and building flexible layouts. It serves as the atomic unit for spacing, sizing, and styling within the design system.

MARGIN

BORDER

PADDING

CONTENT

Applies custom CSS properties directly

Controls padding, margin, and dimensions

Acts as a building block for higher-level components

One-Dimensional Layouts

The **Stack** component handles **one-dimensional layouts** — arranging child elements in either a row or column direction. It simplifies alignment, spacing, and distribution of items along a single axis, making it the go-to tool for toolbars, lists, and form groups.

Stack automatically manages spacing between items and supports responsive behavior, collapsing or reflowing as needed based on the available viewport width.

GRID

Two-Dimensional Responsive Layouts

The **Grid** component enables **two-dimensional responsive layouts**, organizing content into rows and columns that adapt fluidly across screen sizes. It provides precise control over placement, spanning, and alignment for complex page structures.

Rows & Columns

Define a flexible grid structure with configurable column counts and row heights

Responsive Breakpoints

Automatically adjusts column spans and gaps at different viewport sizes

Alignment Control

Fine-tune horizontal and vertical alignment of grid items with precision

CARD

Complex Components

The **Card** component is designed for **complex, self-contained UI elements** like product listings and user profiles. It bundles media, text, and actions into a cohesive, reusable container that works across any context.

Product Cards

Display product imagery, title, pricing, and action buttons in a compact, scannable format ideal for e-commerce and catalog views

User Profiles

Showcase user avatars, names, bios, and social connections in a clean, consistent card layout for team pages and directories
